

InsightIQ

From alert to answer

ClickHouse-native automated RCA

Click-a-thon 2026 • InMobi track

Problem

Alerts say what moved.

Teams still spend hours asking why.

Manual slice-and-dice across geo, device, app, advertiser.

Solution

Detect ? Drill down ? Diagnose in seconds

? ClickHouse cascade (baseline, Z-score, attribution)

? Deterministic diagnosis + citations

? Gemini narrates evidence only

? Langfuse traces for trust

How it works

1. Seasonality baseline (same hour ×4 weeks)
2. Noise-floored Z-score
3. Multi-dimensional contribution
4. Ruled-out / seasonality honesty
5. Plain-English diagnosis + chat

Architecture

ClickHouse Cloud = analytical engine

Node API = package evidence

Gemini = narrate

Langfuse = prove the run

Vercel + Railway = hosted demo

Demo

<https://insight-iq-woad.vercel.app>

Alerts ? Investigation ? Diagnosis ? Chat ? Langfuse

Impact

Analysis in the warehouse

Explainability over black-box ML

Built for the unseen incident

(export + evidence hash + traces)

Thanks
